Research supported in part by NSF under Grant CCF-083783
Outline

• Overview of conservation laws
• Preliminary definitions and tools for computing conservation laws
• Conservation laws for the Zakharov-Kuznetsov equation
• Other examples
  ▶ The Camassa-Holm equation
  ▶ The Khoklov-Zabolotskaya equation
Methods for Computing Conservation Laws

• Use Noether’s Theorem (Lagrangian formulation)

• Direct methods (Anderson, Bluman, Anco, Wolf, etc.) based on solving ODEs (or PDEs)

• Proposed strategy:
  • Density is linear combination of scaling invariant terms with undetermined coefficients
  • Use variational derivative (Euler operator) to compute the undetermined coefficients
  • Use the homotopy operator to compute the flux (invert $D_x$ or Div)
  • Work with linearly independent pieces in finite dimensional spaces
Notation

Independent variables: \( \mathbf{x} = (x^1, x^2, x^3) = (x, y, z) \)

Dependent variables: \( \mathbf{u} = (u^1, u^2, \ldots, u^j, \ldots, u^N) \)

In examples, \((u^1, u^2) = (u, v)\)

Partial Derivatives: \( \frac{\partial^2 u}{\partial x^2} = u_{2x}, \frac{\partial^5 u}{\partial x^3 \partial y^2} = u_{3x2y}, \frac{\partial^k u}{\partial x^k} = u_{kx} \)

\( \mathbf{u}^{(M)} \) represents all components of \( \mathbf{u} \) and all partial derivatives of components of \( \mathbf{u} \) up to order \( M \)

\( f = f(\mathbf{x}, \mathbf{u}^{(M)}(\mathbf{x})) \) is a differential function where operations take place on the jet space

For \( \mathbf{x} = (x, y) \) and \( \mathbf{u} = (u, v) \), the jet space for second order derivatives has the coordinate \((\mathbf{x}, \mathbf{u}^{(2)}(\mathbf{x})) = (x, y, u, v, u_x, u_y, v_x, v_y, u_{2x}, u_{xy}, u_{2y}, v_{2x}, v_{xy}, v_{2y})\)
Tool: The Total Derivative Operator

\[ D_x f = \frac{\partial f}{\partial x} + \sum_{j=1}^{N} \sum_{k_1=0}^{M_1^j} \sum_{k_2=0}^{M_2^j} u^j_{(k_1+1)xk_2y} \frac{\partial f}{\partial u^j_{k_1xk_2y}} \]

Example: Let \( f = x^2u_y + yu_x^2 - u^2u_{2x} \)

\[ D_x = \frac{\partial f}{\partial x} + \sum_{k_1=0}^{2} \sum_{k_2=0}^{1} u_{(k_1+1)xk_2y} \frac{\partial f}{\partial u_{k_1xk_2y}} \]

\[ D_x = \frac{\partial f}{\partial x} + u_x \frac{\partial f}{\partial u} + u_{2x} \frac{\partial f}{\partial u_x} + u_{3x} \frac{\partial f}{\partial u_{2x}} + uy \frac{\partial f}{\partial u_y} \]

\[ D_x = 2xu_y - u_x(2uu_{2x}) + u_{2x}(2yu_x) - u_{3x}(u^2) + uy(x^2) \]

\[ D_x = 2xu_y + x^2u_{xy} + 2yu_xu_{2x} - 2uu_xu_{2x} - u^2u_{3x} \]
Conservation Law

$$D_t \rho + \text{Div} \mathbf{J} = 0 \quad \text{on PDE}$$

$\rho$ is the “conserved density” \hspace{1cm} $\mathbf{J}$ is the “flux”

The continuity equation is satisfied for all solutions of the PDE.

In 1-D, \hspace{1cm} $\mathbf{J} = J$ and \hspace{1cm} $\text{Div} \mathbf{J} = D_x J$

In 2-D, \hspace{1cm} $\mathbf{J} = (J^1, J^2)$ and \hspace{1cm} $\text{Div} \mathbf{J} = D_x J^1 + D_y J^2$

In 3-D, \hspace{1cm} $\mathbf{J} = (J^1, J^2, J^3)$ and \hspace{1cm} $\text{Div} \mathbf{J} = D_x J^1 + D_y J^2 + D_z J^3$
Tool: Euler Operator (Variational Derivative)

For the 2-D case,

\[ \mathcal{L}_u(x,y)f = \left( \mathcal{L}_{u^1}(x,y)f, \mathcal{L}_{u^2}(x,y)f, \ldots, \mathcal{L}_{u^j}(x,y)f, \ldots, \mathcal{L}_{u^N}(x,y)f \right) \]

\[ \mathcal{L}_{u^j}(x,y)f = \sum_{k_1=0}^{M_1^j} \sum_{k_2=0}^{M_2^j} (-D_x)^{k_1} (-D_y)^{k_2} \frac{\partial f}{\partial u^j_{k_1x k_2y}}, \quad j = 1, \ldots, N \]
Tool: Euler Operator (Variational Derivative)

For the 2-D case,

\[
\mathcal{L}_u(x,y)f = \left( \mathcal{L}_{u^1}(x,y)f, \mathcal{L}_{u^2}(x,y)f, \ldots, \mathcal{L}_{u^j}(x,y)f, \ldots, \mathcal{L}_{u^N}(x,y)f \right)
\]

\[
\mathcal{L}_{u^j}(x,y)f = \sum_{k_1=0}^{M_1^j} \sum_{k_2=0}^{M_2^j} (-D_x)^{k_1} (-D_y)^{k_2} \frac{\partial f}{\partial u_{k_1xk_2y}}, \quad j = 1, \ldots, N
\]

**Definition:** In 1-D, \( f \) is exact when there is \( F \) such that \( f = D_x F \).

In multi-D, \( f \) is exact when there is \( F \) such that \( f = \text{Div } F \).
Tool: Euler Operator (Variational Derivative)

For the 2-D case,

\[ \mathcal{L}_u(x,y)f = \left( \mathcal{L}_u^1(x,y)f, \mathcal{L}_u^2(x,y)f, \ldots, \mathcal{L}_u^j(x,y)f, \ldots, \mathcal{L}_u^N(x,y)f \right) \]

\[ \mathcal{L}_u^j(x,y)f = \sum_{k_1=0}^{M_1^j} \sum_{k_2=0}^{M_2^j} (-D_x)^{k_1}(-D_y)^{k_2} \frac{\partial f}{\partial u^j_{k_1xk_2y}}, \quad j = 1, \ldots, N \]

**Definition:** In 1-D, \( f \) is exact when there is \( F \) such that \( f = D_x F \).

In multi-D, \( f \) is exact when there is \( F \) such that \( f = \text{Div } F \).

**Key Theorem:** \( f \) is exact if and only if \( \mathcal{L}_u(x)f \equiv 0 \).
Example: Let \( f = u_x^2 v_{xy} + 2u_x u_{2x} v_y + 3v_x^2 v_{xy} \)

\[
\mathcal{L}_{u(x,y)} f = (-D_x) \frac{\partial f}{\partial u_x} + (-D_x)^2 \frac{\partial f}{\partial u_{2x}}
\]

\[
= -D_x (2u_x v_{xy} + 2u_{2x} v_y) + D_x^2 (2u_x v_y)
\]

\[
= -2u_x v_{2xy} - 4u_{2x} v_{xy} - 2u_{3x} v_x + 2u_x v_{2xy}
\]

\[+ 4u_{2x} v_{xy} + 2u_{3x} v_x \equiv 0\]

\[
\mathcal{L}_{v(x,y)} f = (-D_x) \frac{\partial f}{\partial v_x} + (-D_y) \frac{\partial f}{\partial v_y} + (-D_x)(-D_y) \frac{\partial f}{\partial v_{xy}}
\]

\[
= -D_x (3v_{xy}) - D_y (2u_x u_{2x}) + D_x D_y (u_x^2 + 3v_x)
\]

\[
= -6v_{2x} v_{xy} - 6v_x v_{2xy} - 2u_{xy} u_{2x} - 2u_x u_{2xy} + 6v_{2x} v_{xy}
\]

\[+ 6v_x v_{2xy} + 2u_{xy} u_{2x} + 2u_x u_{2xy} \equiv 0\]
Example: Let \( f = u_x^2 v_{xy} + 2u_x u_{2x} v_y + 3v_x^2 v_{xy} \)

\[
\mathcal{L}_{u(x,y)} f = \left( -D_x \right) \frac{\partial f}{\partial u_x} + \left( -D_x \right)^2 \frac{\partial f}{\partial u_{2x}} \\
= -D_x(2u_x v_{xy} + 2u_{2x} v_y) + D_x^2(2u_x v_y) \\
= -2u_x v_{2xy} - 4u_{2x} v_{xy} - 2u_{3x} v_x + 2u_x v_{2xy} \\
+ 4u_{2x} v_{xy} + 2u_{3x} v_x \equiv 0
\]

\[
\mathcal{L}_{v(x,y)} f = \left( -D_x \right) \frac{\partial f}{\partial v_x} + \left( -D_y \right) \frac{\partial f}{\partial v_y} + \left( -D_x \right) \left( -D_y \right) \frac{\partial f}{\partial v_{xy}} \\
= -D_x(3v_{xy}) - D_y(2u_x u_{2x}) + D_x D_y(u_x^2 + 3v_x) \\
= -6v_{2x} v_{xy} - 6v_x v_{2xy} - 2u_{xy} u_{2x} - 2u_x u_{2xy} + 6v_{2x} v_{xy} \\
+ 6v_x v_{2xy} + 2u_{xy} u_{2x} + 2u_x u_{2xy} \equiv 0
\]

By hand, \( \mathbf{F} = \text{Div}^{-1} f = (u_x^2 v_y, v_x^3) \)
The Zakharov-Kuznetsov (ZK) Equation and Conservation Laws

The (2+1)-dimensional equation models ion-sound solitons in a low pressure uniform magnetized plasma

\[ u_t + \alpha uu_x + \beta(u_{2x} + u_{2y})_x = 0 \]

Conservation Laws:

\[ \begin{align*}
D_t(u) + D_x\left(\frac{\alpha}{2}u^2 + \beta u_{2x}\right) + D_y\left(\beta u_{xy}\right) &= 0 \\
D_t(u^2) + D_x\left(\frac{2\alpha}{3}u^3 - \beta(u_x^2 - u_y^2) + 2\beta u(u_{2x} + u_{2y})\right) + D_y\left(-2\beta u_x u_y\right) &= 0
\end{align*} \]
More Conservation Laws:

\[
D_t \left( u^3 - \frac{3\beta}{\alpha} (u_x^2 + u_y^2) \right) + D_x \left( \frac{3\alpha}{4} u^4 + 3\beta u^2 u_{2x} - 6\beta u (u_x^2 + u_y^2) + \frac{3\beta^2}{\alpha} (u_{2x}^2 - u_{2y}^2) - \frac{6\beta^2}{\alpha} (u_x (u_{3x} + u_{x2y}) + u_y (u_{2xy} + u_{3y})) \right) \\
+ D_y \left( 3\beta u^2 u_{xy} + \frac{6\beta^2}{\alpha} u_{xy} (u_{2x} + u_{2y}) \right) = 0
\]

\[
D_t \left( tu^2 - \frac{2}{\alpha} xu \right) + D_x \left( t \left( \frac{2\alpha}{3} u^3 - \beta (u_x^2 - u_y^2) + 2\beta u (u_{2x} + u_{2y}) \right) - x (u^2 + \frac{2\beta}{\alpha} u_{2x}) + \frac{2\beta}{\alpha} u_x \right) \\
- D_y \left( 2\beta (tu_x u_y + \frac{1}{\alpha} xu_{xy}) \right) = 0
\]
How Conservation Laws Are Computed

1. Determine a scaling symmetry for the PDE

   **Example:** The ZK equation is invariant under the scaling symmetry

   $$(t, x, y, u) \rightarrow \left( \frac{t}{\lambda^3}, \frac{x}{\lambda}, \frac{y}{\lambda}, \lambda^2 u \right)$$

   **Note:**
   - \( \frac{x}{\lambda} \Rightarrow \lambda \frac{\partial}{\partial x} \)
   - \( \frac{y}{\lambda} \Rightarrow \lambda \frac{\partial}{\partial y} \)
   - \( \frac{t}{\lambda^3} \Rightarrow \lambda^3 \frac{\partial}{\partial t} \)

   Using the scaling symmetry, assign weights to each variable

   \[
   W(u) = 2 \\
   W\left( \frac{\partial}{\partial t} \right) = 3 \\
   W\left( \frac{\partial}{\partial x} \right) = 1 \\
   W\left( \frac{\partial}{\partial y} \right) = 1.
   \]
2. Construct a candidate density

**Definition:** The “rank” of a monomial is the sum of the weights of the variables.

**Example:** The rank of the monomial \( \alpha uu_x \) from the ZK equation is \( W(u) + W(u) + W(\frac{\partial}{\partial x}) = 5 \).
2. Construct a candidate density

**Definition:** The “rank” of a monomial is the sum of the weights of the variables

**Example:** The rank of the monomial $\alpha uu_x$ from the ZK equation is $W(u) + W(u) + W(\frac{\partial}{\partial x}) = 5$

The conservation law is invariant under the scaling symmetry of the PDE.
Choose rank 6 and find all terms with rank 6 using the scaling symmetry

\[ \{ u^3, u_x^2, uu_2x, u_y^2, uu_2y, u_x u_y, uu_xy, u_4x, u_3xy, u_2x_2y, u_x_3y, u_4y \} \]

Remove divergences and divergence-equivalent terms. The candidate density is a linear combination of the remaining terms

\[ \rho = c_1 u^3 + c_2 u_x^2 + c_3 u_y^2 + c_4 u_x u_y \]
3. Calculate the undetermined coefficients in the candidate density

Find $D_t \rho$.

$$D_t \rho = 3c_1 u^2 u_t + 2c_2 u_x u_{tx} + 2c_3 u_y u_{ty} + c_4 (u_{tx} u_y + u_x u_{ty})$$

Compute $E = -D_t \rho$ by using the ZK equation to replace all $u_t$

$$E = 3c_1 u^2 (\alpha uu_x + \beta (u_{2x} + u_{2y})_x)$$

$$+ 2c_2 u_x (\alpha uu_x + \beta (u_{2x} + u_{2y})_x)_x$$

$$+ 2c_3 u_y (\alpha uu_x + \beta (u_{2x} + u_{2y})_x)_y$$

$$+ c_4 (u_y (\alpha uu_x + \beta (u_{2x} + u_{2y})_x)_x$$

$$+ u_x (\alpha uu_x + \beta (u_{2x} + u_{2y})_x)_y)$$
Require $E = -D_t \rho$ to be a divergence since $-D_t \rho = \text{Div } J$

$0 \equiv \mathcal{L}_{u(x,y)} E$

$= -2((3c_1 \beta + c_3 \alpha) u_x u_{2y} + 2(3c_1 \beta + c_3 \alpha) u_y u_{xy}$

$\quad + 2c_4 \alpha u_x u_{xy} + c_4 \alpha u_y u_{2x} + 3(3c_1 \beta + c_2 \alpha) u_x u_{2x})$
Require $E = -D_t \rho$ to be a divergence since $-D_t \rho = \text{Div} J$

$0 \equiv \mathcal{L}_{u(x,y)} E$

$= -2 ((3c_1\beta + c_3\alpha)u_xu_{2y} + 2(3c_1\beta + c_3\alpha)u_yu_{xy}$

$+ 2c_4\alpha u_xu_{xy} + c_4\alpha u_yu_{2x} + 3(3c_1\beta + c_2\alpha)u_xu_{2x})$

Solve the linear system of coefficients.

$3c_1\beta + c_3\alpha = 0, \quad c_4\alpha = 0, \quad 3c_1\beta + c_2\alpha = 0$

$c_1 = 1, \quad c_2 = -\frac{3\beta}{\alpha}, \quad c_3 = -\frac{3\beta}{\alpha}, \quad c_4 = 0$

The density is $\rho = u^3 - \frac{3\beta}{\alpha} (u_x^2 + u_y^2)$. 
Require $E = -D_t \rho$ to be a divergence since

$-D_t \rho = \text{Div } J$

\[
0 \equiv \mathcal{L}_{u(x,y)} E \\
= -2 ((3c_1 \beta + c_3 \alpha) u_x u_{2y} + 2(3c_1 \beta + c_3 \alpha) u_y u_{xy} \\
+ 2c_4 \alpha u_x u_{xy} + c_4 \alpha u_y u_{2x} + 3(3c_1 \beta + c_2 \alpha) u_x u_{2x})
\]

Solve the linear system of coefficients.

\[
3c_1 \beta + c_3 \alpha = 0, \quad c_4 \alpha = 0, \quad 3c_1 \beta + c_2 \alpha = 0
\]

\[
c_1 = 1, \quad c_2 = -\frac{3 \beta}{\alpha}, \quad c_3 = -\frac{3 \beta}{\alpha}, \quad c_4 = 0
\]

The density is \( \rho = u^3 - \frac{3 \beta}{\alpha} (u_x^2 + u_y^2) \).

4. Compute the flux
Computer Demonstration

The program *ConservationLawsMD.m* will compute the conservation laws for the ZK equation.
Tool: The Homotopy Operator

• integrates an exact 1-D differential expression by parts

• inverts the divergence of an exact multi-D differential expression

Let \( f = u_x v_{2x} \cos u + v_{3x} \sin u - v_{4x} \)

\( (\mathcal{L}_u(x), \mathcal{L}_v(x)) = (0, 0) \), so \( f \) is exact
Tool: The Homotopy Operator

- integrates an exact 1-D differential expression by parts
- inverts the divergence of an exact multi-D differential expression

Let \( f = u_x v_{2x} \cos u + v_{3x} \sin u - v_{4x} \)

\((\mathcal{L}_{u(x)}, \mathcal{L}_{v(x)}) = (0, 0)\), so \( f \) is exact

*Mathematica’s* `Integrate` returns

\[
\int (u_x v_{2x} \cos u + v_{3x} \sin u - v_{4x}) \, dx
\]
Tool: The Homotopy Operator

• integrates an exact 1-D differential expression by parts

• inverts the divergence of an exact multi-D differential expression

Let \( f = u_x v_{2x} \cos u + v_{3x} \sin u - v_{4x} \)

\( (\mathcal{L}_u(x), \mathcal{L}_v(x)) = (0, 0), \) so \( f \) is exact

**Mathematica’s Integrate** returns

\[
\int (u_x v_{2x} \cos u + v_{3x} \sin u - v_{4x}) \, dx
\]

The homotopy operator returns \( v_{2x} \sin u - v_{3x} \)
Tool: The Homotopy Operator

- integrates an exact 1-D differential expression by parts
- inverts the divergence of an exact multi-D differential expression

Let \( f = u_x v_{2x} \cos u + v_{3x} \sin u - v_{4x} \)

\((\mathcal{L}_u(x), \mathcal{L}_v(x)) = (0, 0)\), so \( f \) is exact

\text{Mathematica's Integrate returns} \[
\int (u_x v_{2x} \cos u + v_{3x} \sin u - v_{4x}) \, dx
\]

\text{The homotopy operator returns} \( v_{2x} \sin u - v_{3x} \)

\text{Mathematica cannot invert a divergence!!!}
The 2-D Homotopy Operator

\( f \) is an exact differential function, i.e., \( f = \text{Div} \, \mathbf{F} \)

\[
\mathbf{F} = \left( \mathcal{H}^{(x)}_{u(x,y)} f, \mathcal{H}^{(y)}_{u(x,y)} f \right)
\]

\[
= \left( \int_{\lambda_0}^{1} \sum_{j=1}^{N} \left( \mathcal{I}^{(x)}_{u^j(x,y)} f \right) \left[ \lambda u \right] \frac{d\lambda}{\lambda}, \int_{\lambda_0}^{1} \sum_{j=1}^{N} \left( \mathcal{I}^{(y)}_{u^j(x,y)} f \right) \left[ \lambda u \right] \frac{d\lambda}{\lambda} \right)
\]

\[
\mathcal{I}^{(x)}_{u^j(x,y)} f = \sum_{k_1=1}^{M_1^j} \sum_{k_2=0}^{M_2^j} \left( \sum_{i_1=0}^{k_1-1} \sum_{i_y=0}^{k_2} \frac{(i_1+i_2)(k_1+k_2-i_1-i_2-1)}{(k_1-i_1-1)} \right) u_{i_1 x i_2 y} \left( -\nabla_x \right)^{k_1-i_1-1} \left( -\nabla_y \right)^{k_2-i_2} \frac{\partial f}{\partial u^j_{k_1 x k_2 y}}
\]

\[
\mathcal{I}^{(y)}_{u^j(x,y)} f = \sum_{k_1=0}^{M_1^j} \sum_{k_2=1}^{M_2^j} \left( \sum_{i_1=0}^{k_1} \sum_{i_2=0}^{k_2-1} \frac{(i_1+i_2)(k_1+k_2-i_1-i_2-1)}{(k_2-i_2-1)} \right) u_{i_1 x i_2 y} \left( -\nabla_x \right)^{k_1-i_1} \left( -\nabla_y \right)^{k_2-i_2-1} \frac{\partial f}{\partial u^j_{k_1 x k_2 y}}
\]
Example: Compute the flux corresponding to the density $\rho = u^3 - \frac{3\beta}{\alpha}(u_x^2 + u_y^2)$ for the ZK equation. From the continuity equation: $\mathbf{J} = \text{Div}^{-1}(-D_t\rho) = \text{Div}^{-1} E$.

Let $A = \alpha uu_x + \beta(u_3x + u_x2y)$ so that

$$E = 3u^2A - \frac{6\beta}{\alpha}u_xA_x - \frac{6\beta}{\alpha}u_yA_y$$

$$\mathbf{J} = \left( \mathcal{H}^{(x)}_{\mathbf{u}(x,y)}E, \mathcal{H}^{(y)}_{\mathbf{u}(x,y)}E \right)$$

$$= \left( \frac{3}{4}\alpha u^4 + \beta u^2(3u_{2x} + 2u_{2y}) - \beta u(6u_x^2 + 2u_y^2) + \frac{3\beta^2}{4\alpha}u(u_{2x2y} + u_{4y}) - \frac{\beta^2}{\alpha}u_x\left(\frac{7}{2}u_{x2y} + 6u_{3x}\right) - \frac{\beta^2}{\alpha}u_y(4u_{2xy} + \frac{3}{2}u_{3y}) + \frac{\beta^2}{\alpha}(3u_{2x}^2 + \frac{5}{2}u_{xy}^2 + \frac{3}{4}u_{2y}^2) + \frac{5\beta^2}{4\alpha}u_{2x}u_{2y}, \beta u^2 u_{xy} - 4\beta uu_xu_y - \frac{3\beta^2}{4\alpha}u(u_{x3y} + u_{3xy}) - \frac{\beta^2}{4\alpha}u_x(13u_{2xy} + 3u_{3y}) - \frac{5\beta^2}{4\alpha}u_y(u_{3x} + 3u_x2y) + \frac{9\beta^2}{4\alpha}u_{xy}(u_{2x} + u_{2y}) \right)$$
\( \text{Div}^{-1} f \) is not unique

\[ f = \text{Div} \, F \quad \text{where} \quad F = (G^1 + D_y \theta, \; G^2 - D_x \theta), \quad \theta \text{ is any differential function, and} \quad f = \text{Div} (G^1, G^2) \]

The homotopy operator often returns \( F \) with a particular "curl" term. In 2-D, \( K = (D_y \theta, -D_x \theta) \).

For \( J \) from the ZK equation,

\[ \theta = 2 \beta u^2 u_y + \frac{3 \beta^2}{4 \alpha} u(u_{2xy} + u_{3y}) + \frac{5 \beta^2}{2 \alpha} u_x u_{xy} + \frac{15 \beta^2}{4 \alpha} u_y u_{2y} + \frac{5 \beta^2}{4 \alpha} u_{2x} u_y \]

The flux without the "curl" term, \( \tilde{J} = J - K \),

\[
\tilde{J} = \left( \frac{3 \alpha}{4} u^4 + 3 \beta u^2 u_{2x} - 6 \beta u(u_x^2 + u_y^2) + \frac{3 \beta^2}{\alpha} (u_{2x}^2 - u_{2y}^2) \right) \\
- \frac{6 \beta^2}{\alpha} (u_x (u_{3x} + u_{2xy}) + u_y (u_{2xy} + u_{3y})), \\
3 \beta u^2 u_{xy} + \frac{6 \beta^2}{\alpha} u_{xy} (u_{2x} + u_{2y}) \right) 
\]
Conservation Laws for the (2+1)-dimensional Camassa-Holm (CH) equation

\[(u_t + \kappa u_x - u_{t2x} + 3uu_x - 2u_xu_{2x} - uu_{3x})_x + u_{2y} = 0\]

Two problems:

- The CH equation is not an evolution equation
- The CH equation does not have scaling symmetry
Evolution equations are required to be able to compute values for the undetermined coefficients in the candidate density.

The CH equation is transformed by interchanging $t$ with $y$

$$(u_y + \kappa u_x - u_{2xy} + 3uu_x - 2u_xu_{2x} - uu_{3x})_x + u_{2t} = 0$$

Then set $v = u_t$. This forms a system of evolution equations

$$u_t = v$$

$$v_t = -u_{xy} - \kappa u_{2x} + u_{3xy} - 3u_x^2 - 3uu_{2x} + 2u_{2x}^2$$

$$+ 3u_xu_{3x} + uu_{4x}$$
A scaling symmetry exists when parameters $\alpha$ and $\beta$ are introduced

\[ u_t = v, \]
\[ v_t = -\alpha u_{xy} - \kappa u_{2x} + u_{3xy} - 3\beta u_x^2 - 3\beta uu_{2x} + 2u_{2x}^2 + 3u_x u_{3x} + uu_{4x} \]

Parameters $\alpha$, $\beta$, and $\kappa$ are included in the scaling symmetry

\[(u, v, \alpha, \beta, \kappa, t, x, y) \longrightarrow (\lambda u, \lambda^{7/2} v, \lambda^2 \alpha, \lambda^2 \beta, \lambda^3 \kappa, \frac{t}{\lambda^{5/2}}, \frac{x}{\lambda}, \frac{y}{\lambda^2})\]
Conservation Laws:

\[
\begin{align*}
\mathcal{D}_t(fu) + \mathcal{D}_x\left(\frac{1}{\alpha} f \left(\frac{3}{2} \beta u^2 + \kappa u - \frac{1}{2} u_x^2 - uu_{2x} - u_{tx}\right) \right) \\
- (\frac{1}{\alpha} f_x - \frac{1}{2} f'y^2) \left(\alpha u_t + \kappa u_x + 3 \beta uu_x - 2u_x u_{2x} - uu_{3x} - u_{t2x}\right) \\
- D_y\left(uy \left(\frac{1}{\alpha} f x - \frac{1}{2} f'y^2\right) + f'y u\right) = 0
\end{align*}
\]

\[
\begin{align*}
\mathcal{D}_t(fyu) + \mathcal{D}_x\left(\frac{1}{\alpha} fy \left(\frac{3}{2} \beta u^2 + \kappa u - \frac{1}{2} u_x^2 - uu_{2x} - u_{tx}\right) \right) \\
- y(\frac{1}{\alpha} f x - \frac{1}{2} f'y^2) \left(\alpha u_t + \kappa u_x + 3 \beta uu_x - 2u_x u_{2x} - uu_{3x} - u_{t2x}\right) \\
- D_y\left(yu_y \left(\frac{1}{\alpha} f x - \frac{1}{2} f'y^2\right) - u \left(\frac{1}{\alpha} f x - \frac{1}{2} f'y^2\right)\right) = 0
\end{align*}
\]

where \( f = f(t) \) is an arbitrary function
Computer Demonstration

Results when ConservationLawsMD.m computes several conservation laws for the CH equation
Conservation Laws for the (3+1)-dimensional Khoklov-Zabolotskaya (KZ) equation

\[(u_t - uu_x)_x - u_{2y} - u_{2z} = 0\]

Conservation Law:

For \( f = f(t, y, z) \) and \( g = g(t, y, z) \),

\[
\begin{align*}
D_t(fu) &- D_x \left( \frac{1}{2} fu^2 + (fx + g)(u_t - uu_x) \right) \\
- D_y \left( (fyx + gy)u - (fx + g)uy \right) &- D_z \left( (fzx + gz)u - (fx + g)uz \right) = 0
\end{align*}
\]

under the constraints \( \Delta f = 0 \) and \( \Delta g = f_t \)
Conclusions

• The conservation laws program is fast and has computed conservation laws for a variety of PDEs. Improvements to the code will allow for a broader class of PDEs.

• The program ConservationLawsMD.m is available at http://inside.mines.edu/~whereman under scientific software
