

## Homework #1 Solution

Calculate the water fractional flow ( $f_w$ ) as a function of water saturation ( $S_w$ ) and plot  $f_w$  versus  $S_w$  for the following fluid system:

$$k_{rw}^* = 0.1$$

$$k_{row}^* = 0.7$$

$$n_w = 1.5$$

$$n_o = 0.25$$

$$S_{orw} = 0.30$$

$$S_{wr} = 0.25$$

$$\mu_w = 0.6 \text{ cp}$$

$$\mu_o = 2.4 \text{ cp}$$

The water fractional flow ( $f_w$ ) is calculated using the following expression,

$$f_w = \frac{\lambda_w(S_w)}{\lambda_w(S_w) + \lambda_o(S_w)}$$

Where,

$$\text{mobility of water is, } \lambda_w(S_w) = \frac{k_{rw}(S_w)}{\mu_w}$$

$$\text{and mobility of oil is, } \lambda_o(S_w) = \frac{k_{ro}(S_w)}{\mu_o}$$

The relative permeability is calculated as a function of saturation using the Corey correlation,

$$k_{rw} = k_{rw} * \left( \frac{S_w - S_{wr}}{1 - S_{orw} - S_{wr}} \right)^{n_w}$$

$$k_{ro} = k_{ro} * \left( \frac{S_o - S_{orw}}{1 - S_{orw} - S_{wr}} \right)^{n_o}$$

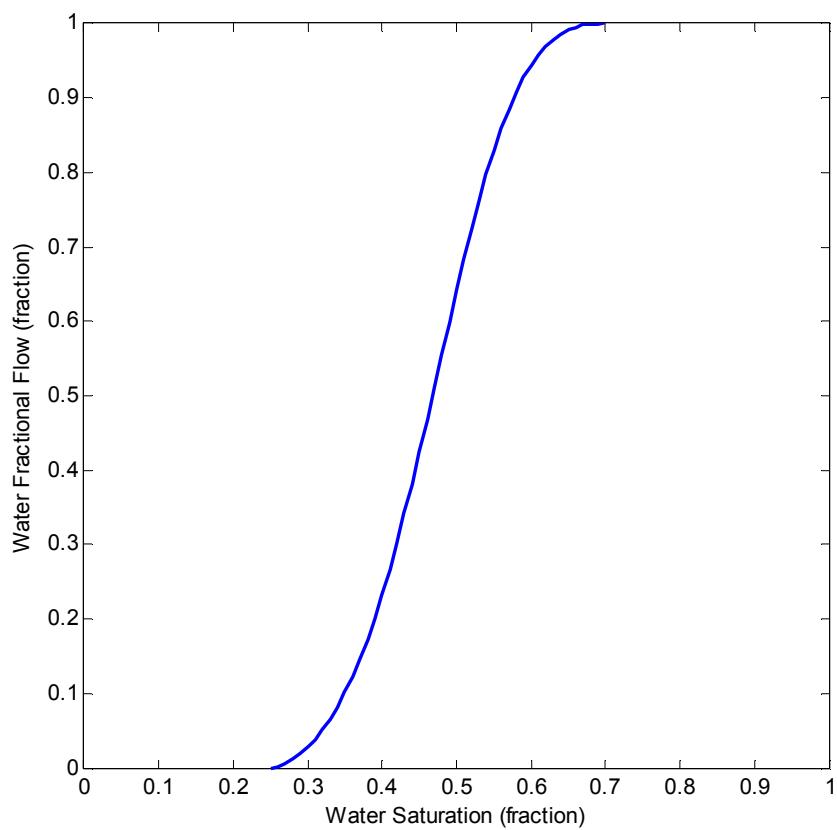

The

Table 1 shows the values of water fractional flow as a function of saturation.

**Table 1. Values of Water fractional flow as a function of water saturation**

Water Saturation (fraction)	Water Fractional Flow (fraction)
0.25	0
