Implementing
the Method

Simulations

Convergence

Conclusion

KdV:

$$\partial_t \phi(x, t) + \mu \partial_x^3 \phi(x, t) + \epsilon \phi \partial_x \phi(x, t) = 0,$$

$$x \in [a, b], \quad t \geq 0$$

- KdV is commonly used in Hydrodynamics to model shallow water waves.
- Similar to Advection Equation

Conclusion

In one dimension, a collocation method approximates a solution to an ordinary differential equation, $F(\phi) = 0$, with a function in a finite dimensional function space.

- Given our function space, let our basis functions be $\{v_1, \dots, v_N\}$
- We approximate the solution to our differential equation with a linear combination of these basis functions:

$$\phi \approx \Phi = \sum_{i=1}^N \alpha_i v_i(x).$$

Collocation Method Cont.

Physical
Background

Collocation
Method

Implementing
the Method

Simulations

Convergence

Conclusion

Suppose we are approximating the solution on the interval $[a, b]$ with a uniform partition $\{x_1, \dots, x_m\}$. We construct Φ such that:

$$F(\Phi(x_{j+1/2})) = 0 \quad \forall j \in \{1, \dots, M-1\}$$

where

$$x_{j+1/2} = \frac{x_{j+1} + x_j}{2}$$

We now have a system of $M-1$ equations.

Using boundary conditions, more equations can be constructed.

Convergence

Conclusion

To implement 1-D collocation method for a PDE, we approximate the solution ϕ with

$$\phi \approx \Phi = \sum_{i=1}^N \alpha_i(t) v_i(x).$$

Following the same process as before, we come up with a system of differential equations, with unknown α_i , which may be solved by a Finite Difference Method.

Problem Statement

KdV:

$$\partial_t \phi(x, t) + \mu \partial_x^3 \phi(x, t) + \epsilon \phi \partial_x \phi(x, t) = 0,$$

$$x \in [a, b], \quad t \geq 0$$

With boundary conditions:

- $\phi(a, t) = 0$
- $\phi(b, t) = 0$
- $\partial_x \phi(b, t) = 0$

And an initial condition:

- $\phi(x, 0) = \phi_0(x)$

Function Space

Collocation
Method

Implementing
the Method

Simulations

Convergence

Conclusion

- We choose a partition of the interval $[a, b]$:
 $P = \{x_1, \dots, x_N\}$.
- Let S_3 be our function space. S_3 is the set of all cubic splines on P such that $f \in S_3$, then $f \in C^2[a, b]$.
- For a given P , S_3 has a basis consisting of $N + 2$ elements:
 $B = \{v_1, \dots, v_{N+2}\}$

Thus

$$\Phi = \sum_{i=1}^{N+2} \alpha_i(t) v_i(x)$$

System of ODEs

One-
Dimensional
Collocation
Method for
the
Korteweg-de
Vries Equation

Kerrek
Stinson

Physical

Collocation
Method

Implementing
the Method

Simulations

Convergence

Conclusion

$$\partial_t \Phi(t, x_{j+1/2}) + \mu \partial_x^3 \Phi(t, x_{j+1/2}) + \epsilon \Phi \partial_x \Phi(t, x_{j+1/2}) = 0,$$

$$\forall j \in \{1, \dots, N-1\}$$

represents our system of differential equations.

With boundary conditions:

- $\Phi(a, t) = 0$
- $\Phi(b, t) = 0$
- $\partial_x \Phi(b, t) = 0$

we have $N-1$ differential equations and 3 algebraic relations for the boundary conditions.

Initial Condition for System of ODEs

the
Korteweg-de
Vries Equation

Kerrek
Stinson

Physical
Background

Collocation
Method

Implementing
the Method

Simulations

Convergence

Conclusion

Let us choose the initial condition for our approximation to satisfy

$$\Phi(x_{j+1/2}, 0) = \phi_0(x_{j+1/2}), \quad \forall j \in \{1, \dots, N-1\}$$

Using these equations and the boundary conditions, our initial condition is found solving a linear system.

Let $t \in [0, T]$, and choose a uniform partition of $[0, T]$: $\{t_0, \dots, t_m\}$, $\Delta t = 1/m$.

Backward Euler

One-
Dimensional
Collocation
Method for
the
Korteweg-de
Vries Equation

Kerrek

Physical
Background

Collocation
Method

Implementing
the Method

Simulations

Convergence

Conclusion

We employ Backward Euler, with a slight modification:

$$\frac{\Phi(t_{i+1}, x_{j+1/2}) - \Phi(t_i, x_{j+1/2})}{\Delta t} + \dots$$

$$\mu \partial_x^3 \Phi(t_{i+1}, x_{j+1/2}) + \dots$$

$$\epsilon \Phi(t_i, x_{j+1/2}) \partial_x \Phi(t_{i+1}, x_{j+1/2}) = 0,$$

where we have assumed $\Phi(t_i, x_{j+1/2}) \approx \Phi(t_{i+1}, x_{j+1/2})$.

Implementation in Summary

One-
Dimensional
Collocation
Method for
the
Korteweg-de
Vries Equation

Kerrek
Stinson

Physical
Background

Collocation
Method

Implementing
the Method

Simulations

Convergence

Conclusion

- Using Collocation, we reduced KdV to a system of nonlinear ODEs.
- With the aid of Backward Euler and a reasonable assumption, we reduced finding the solution at each time step to a linear system.

All that is left is to model.
