Outline

- Background
- Goal
- Steps to solve
- Algorithm used for each step
- Testing and Results
- Future work
- Questions

Background

- A wordoku puzzle is similar to a sudoku, but uses alphabets instead of numbers.
- A **keyword** is given at the bottom of each puzzle, consists of 9 alphabets that will be used to solve the puzzle.

			R	E		M	W
						O	D
	M					L	G
		R	A	M		D	
	D		L		R		A
		O		D	W	E	
	R	A					D
L	O						
D	E			A	L		

W O R L D G A M E

Goal

- For any given wordoku puzzle (with **any font**), solve the puzzle and display the solution image.

			R	E			M	W
							O	D
	M					L	G	
		R	A	M		D		
	D		L		R		A	
		O		D	W	E		
	R	A					D	
L	O							
D	E			A	L			

W O R L D G A M E

O	G	L	R	E	D	A	M	W
A	W	E	M	L	G	R	O	D
R	M	D	O	W	A	L	G	E
G	L	R	A	M	E	D	W	O
E	D	W	L	O	R	G	A	M
M	A	O	G	D	W	E	L	R
W	R	A	E	G	O	M	D	L
L	O	G	D	R	M	W	E	A
D	E	M	W	A	L	O	R	G

W O R L D G A M E

Steps Involved

- ① **Separate the keyword and grid**
- ② **Extract elements**
- ③ **Find Matches**
- ④ **Solve as a sudoku**
- ⑤ **Paste the solution back**

Step1: Separation

- First, threshold and use Hough transform to find boundary.

	P		K		R	I		D
D			B					R
	B		E			P	A	
P				K	W	A		B
						R	K	
	A	D						
B				E				P
A						E		
E	R		P		K	B		

ABDEIKPRW

	P		K		R	I		D
D			B					R
	B		E			P	A	
P				K	W	A		B
						R	K	
	A	D						
B				E				P
A						E		
E	R		P		K	B		

ABDEIKPRW

Extracted keyword

ABDEIKPRW

Step2: Extraction

1) Keyword :-

- Got rid of any small noises by using *imopen* and *imclose* commands.
- Used the *regionprops* extract the individual characters.
- Assigned values.

Step2: Extraction

2) Puzzle Elements :-

- Used the *houghlines* to extract 20 lines .
- The lines were in random order and it was necessary to sort them.
- Some of the puzzles had thick and thin grid lines. So, I created a new set of lines with average of distances.

Step2: Extraction

2) Puzzle Elements :- (cont...)

- Cropped each element between intersections and stored separately.
- Also, region properties of each element was extracted.

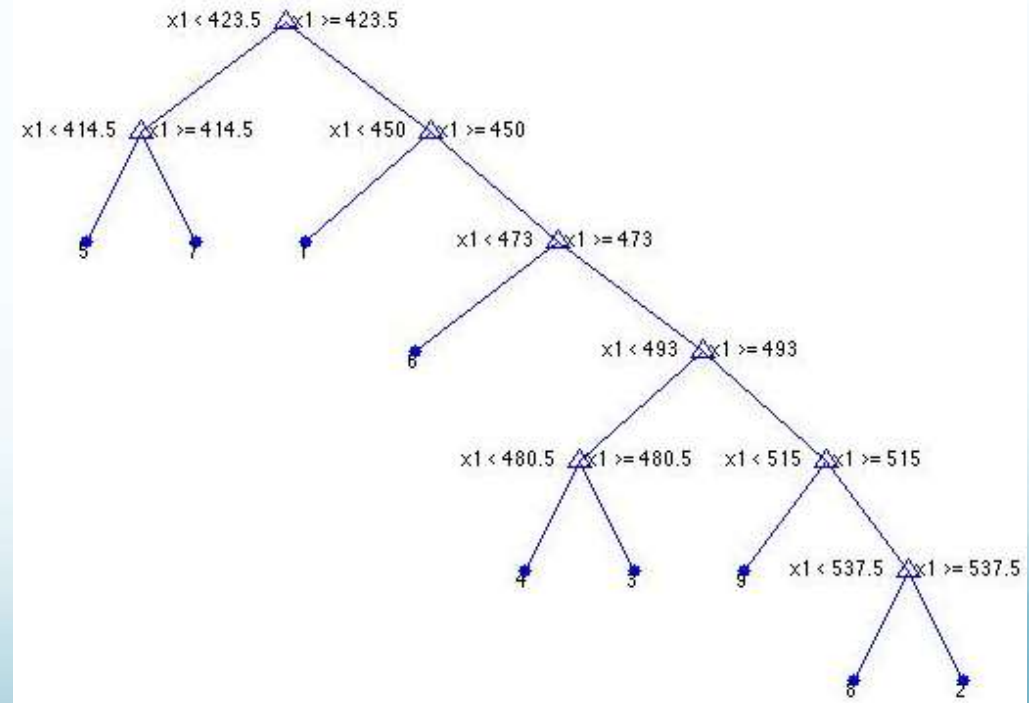

1,1	1,2	1,3	1,4	1,5	1,6	1,7	1,8	1,9
■	P	■	K	■	R	I	■	D
2,1	2,2	2,3	2,4	2,5	2,6	2,7	2,8	2,9
D	■	■	B	■	■	■	■	R
3,1	3,2	3,3	3,4	3,5	3,6	3,7	3,8	3,9
■	B	■	E	■	■	P	A	■
4,1	4,2	4,3	4,4	4,5	4,6	4,7	4,8	4,9
P	■	■	■	K	W	A	■	B
5,1	5,2	5,3	5,4	5,5	5,6	5,7	5,8	5,9
■	■	■	■	■	■	R	K	■
6,1	6,2	6,3	6,4	6,5	6,6	6,7	6,8	6,9
■	A	D	■	■	■	■	■	■
7,1	7,2	7,3	7,4	7,5	7,6	7,7	7,8	7,9
B	■	■	■	E	■	■	■	P
8,1	8,2	8,3	8,4	8,5	8,6	8,7	8,8	8,9
A	■	■	■	■	■	E	■	■
9,1	9,2	9,3	9,4	9,5	9,6	9,7	9,8	9,9
E	R	■	P	■	K	B	■	■

Step3: Matching

1) Classification Tree:

- Use various region properties (area, centroid, axis lengths) to create a decision tree.
- Used this tree to predict the classes(1-9).

This classification gave wrong matches in cases where two or more letters had almost *similar areas and axis lengths*.

Step3: Matching

2) Normalized Cross-Correlation:

- The max scores when each element of the puzzle was cross-correlated with all the 9 key characters was calculated and the max score among these was used to predict the class(1-9) of that element.
- Eroding before using the cross-correlation gave better results.
- Limitation : When one letter could completely fit inside another letter, there was a chance for wrong detection.

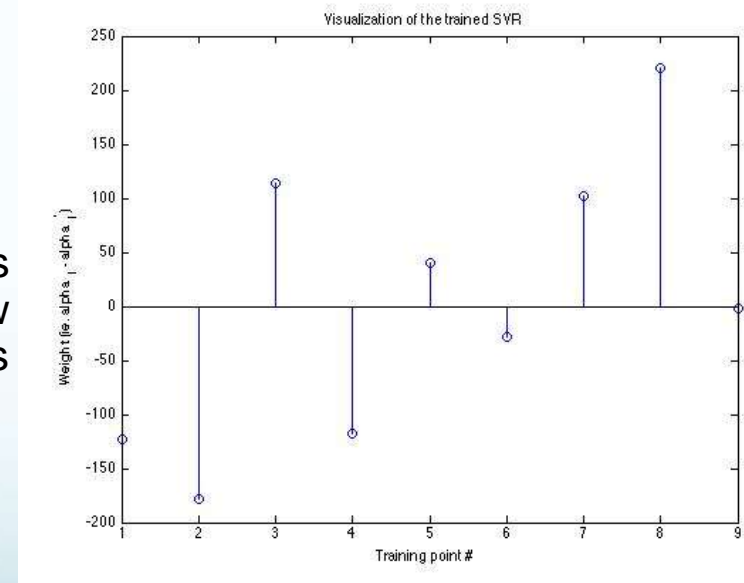

Step3: Matching

3) Support Vector Regression:

- I used different region properties of key characters as a training set to train an SVR algorithm .
- The predictions I found were more accurate and reliable.

-- Limitation: This still depends on the properties like Area, Axis lengths of each element and how much they vary between the different characters used.

Solution?

Combining algorithm -

- All the max cross-correlated scores > 0.68 are stored as the closest matches.
 - And use support vector regression prediction to further narrow down the value.
- Combining both of the algorithms matched 10 different puzzles with 100% accuracy. However, it significantly increases computational time.

Step4:Solving

- The location matrix reduces the problem to a sudoku.
- Using a MATLAB script I found which recursively solves for all possible values for every blank cell in the matrix.

UNSOLVED

0	7	0	6	0	8	5	0	3
3	0	0	2	0	0	0	0	8
0	2	0	4	0	0	7	1	0
7	0	0	0	6	9	1	0	2
0	0	0	0	0	0	8	6	0
0	1	3	0	0	0	0	0	0
2	0	0	0	4	0	0	0	7
1	0	0	0	0	0	4	0	0
4	8	0	7	0	6	2	0	0

SOLVED

9	7	4	6	1	8	5	2	3
3	5	1	2	9	7	6	4	8
8	2	6	4	5	3	7	1	9
7	4	8	5	6	9	1	3	2
5	9	2	3	7	1	8	6	4
6	1	3	8	2	4	9	7	5
2	6	9	1	4	5	3	8	7
1	3	7	9	8	2	4	5	6
4	8	5	7	3	6	2	9	1

Step5:Printing

- I used the sorted hough-lines to find their intersection points using *polyxpoly*, and hence, width and height of each cell separately.
- Paste according to the dimensions of the element.
- Used the amount of black color in each character as reference to print.

$\infty \nabla h \Delta \alpha \beta \chi \delta \Sigma$

Step 5 : Testing/results

Real Images had Real problems -

1) Had to use *cpselect* to manually project the onto a square template

2) Problems with thresholding and detecting houghlines

Tweaking the algorithm-

1) Divide the grid into equal parts and extract.

Needs more testing -

Matching was successful for 1 out images out of 2 images.

Conclusions:

- Able to handle a tilt up to 10 degrees without user interaction.
- It could solve the puzzle for any given font.
- It could solve when lines were missing in the puzzle.
- Has 90 percent (10/11) accuracy.

Limitations:

- Keyword characters need to be separated.
- Could not handle real images without user interaction.
- Noise/thresholding issues for real images.

Future Work

- To optimize the algorithm to handle varying size of keyword and puzzle elements.
- To extend this algorithm to solve for real images with thresholding issues.
